

External Access Subsystem			
Subsystem Code	ex	Component Codes	prox = Caddy Proxy

Data Flows			
ID	Port/Proto	Description	Controls
1	TCP/443	User access to externally-offered applications.	Application-specific enforcements, including TLS and identity checks.
2	TCP/51820	Pre-configured Wireguard VPN connections.	Encrypted and reliable, configured manually from the pfSense management interface.
3	Various	Once authenticated by the Wireguard service, clients are dropped into a dedicated IP space that grants them access to internal applications.	Application-specific enforcements.
4	TCP/443	pfSense forwards inbound TCP/443 connections to the Caddy Proxy.	Caddy provides TLS termination via a publicly trusted cert.
5	TCP/443	Caddy forwards configured paths and URIs to their internal counterparts.	Caddy terminates and allows for inspection of TLS-encrypted sessions, then re-encrypts using the internal certificate chain. vFWs enforce Caddy can only forward to approved destinations.
